### 74HC/HCT9114

Nine wide Schmitt trigger buffer; open drain outputs; inverting

Product specification Supersedes data of March 1988 File under Integrated Circuits, IC06 December 1990

#### 74HC/HCT9114

#### **FEATURES**

- · Schmitt trigger action on all data inputs
- Output capability: standard (open drain)
- I<sub>CC</sub> category: MSI

#### **GENERAL DESCRIPTION**

The 74HC/HCT9114 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT9114 are nine wide Schmitt trigger inverting buffer with open drain outputs and Schmitt trigger inputs.

The Schmitt trigger action in the data inputs transform slowly changing input signals into sharply defined jitter-free output signals.

The 74HC/HCT9114 have open-drain N-transistor outputs, which are not clamped by a diode connected to  $V_{CC}$ . In the OFF-state, i.e. when one input is LOW, the output may be pulled to any voltage between GND and  $V_{Omax}$ . This allows the device to be used as a LOW-to-HIGH or HIGH-to-LOW level shifter. For digital operation and OR-tied output applications, these devices must have a pull-up resistor to establish a logic HIGH level.

The "9114" is identical to the "9115" but has inverting outputs.

#### **QUICK REFERENCE DATA**

GND = 0 V;  $T_{amb} = 25 \, ^{\circ}C$ ;  $t_r = t_f = 6 \, \text{ns}$ 

SYMBOL	PARAMETER	CONDITIONS	TYP	UNIT		
STWIBOL	FARAMETER	CONDITIONS	нс	нст	UNII	
t <sub>PHL</sub> / t <sub>PLZ</sub>	propagation delay $A_n$ to $\overline{Y}_n$	C <sub>L</sub> = 15 pF; V <sub>CC</sub> = 5 V	12	13	ns	
Cı	input capacitance		3.5	3.5	pF	
C <sub>PD</sub>	power dissipation capacitance per buffer	notes 1 and 2	5	5	pF	

#### Notes

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu W$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$$
 where:

f<sub>i</sub> = input frequency in MHz

f<sub>o</sub> = output frequency in MHz

 $\sum (C_L \times V_{CC}^2 \times f_0) = \text{sum of outputs}$ 

C<sub>L</sub> = output load capacitance in pF

V<sub>CC</sub> = supply voltage in V

2. For HC the condition is  $V_I = GND$  to  $V_{CC}$ For HCT the condition is  $V_I = GND$  to  $V_{CC} - 1.5$  V

#### ORDERING INFORMATION

See "74HC/HCT/HCU/HCMOS Logic Package Information".

74HC/HCT9114

#### DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see "74HC/HCT/HCU/HCMOS Logic Family Specifications". Transfer characteristics are given below.

Output capability: standard

I<sub>CC</sub> category: MSI

#### Note to HCT types

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given in the family specifications.

To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
An	0.3
